CONSERVATION INNOVATION.**

FORESTRY MANAGEMENT SERVICES

- Invasive Species Management
- Forestry Mulching
- Tree & Shrub Planting
- Live Staking
- Edge Feathering
- Ecologically-Sensitive Harvesting
- Tree Thinning
- Clear-cutting
- Habitat & Conservation Planning
- Woodland Stewardship Enrollment

Kanati assesses the status of your timber stand and recommends improvements to establish a healthier ecosystem. This provides wildlife with a diverse habitat and increases the natural beauty of your woodlands.

OUR PROCESS

Kanati provides on-site consultation, alternative recommendations, and management services to produce the best outcome for our clients. We offer complete site-prep and installment along with opportunities for financial assistance.

BUCKTHORN MANAGEMENT

Buckthorn is one of Minnesota's most aggressive and damaging invasive plants.

The shrub, or small tree, is especially noticeable in woodlands when it forms dense thickets where few other plant species can co-exist.

HOW DO I KNOW WHICH TREATMENT IS BEST FOR ME?

The area's accessibility and terrain are important to consider as well as time, maintenance, and other surrounding plant types.

The mechanical or biological treatments Kanati employs depend on the severity and age of the targeted plant species. We often use more than one of these treatments at a time to achieve the best outcome for invasive species management.

Forestry Mulching: The best option for large or more dense areas with mature invasives.

Hand-Pulling: Stay ahead of the invasive species by hand-pulling small seedlings.

Hand-Cutting: Performed on any level of infestation and considered the best treatment to control target species.

Prescribed Grazing: Focusing on young plants, goats are used to graze on buckthorn and other invasive species in their reach.
